Quarterly Skills Bulletin no.3 2019

Unemployment
AFTER A PERIOD OF HIGH UNEMPLOYMENT, IRELAND HAS SEEN A RETURN TO PRE-RECESSION LEVELS

How does unemployment compare pre and post-recession?

Over the last 12 years, unemployment has moved through considerable change going from 120,000 unemployed persons in quarter 2 2007, to a high of 356,000 unemployed persons in quarter 3 2011 and returning close to pre-recession numbers of 131,000 in quarter 2 2019.

Between quarter 2 2007 and quarter 2 2019, the number of persons under 25 years has returned to that of pre-recession levels, whereas there are 12,000 more unemployed persons aged 25 years and over than in quarter 2 2007.

Unemployment peaked for young people much earlier than for older people

While unemployment peaked in quarter 2 2009 for those aged under 25 years (at 104,900), it wasn’t until quarter 1 2012 that unemployment for those aged over 25 years reached its highest level (266,400).

The unemployment rate has returned to pre-recession levels...

In quarter 2 2019, the unemployment rate for all persons aged 15-74 years was 5.4%, almost on a par with that observed in quarter 2 2007 (5.2%). In particular, at 4% in quarter 2 2019, the rate for those aged 25 years and over was back to the level at the beginning of the period examined.

...but not for youths

By quarter 2 2019, the youth (i.e. under 25 years) unemployment rate, at 15.7%, while considerably lower than the 33.4% observed in quarter 2 2012, had not yet returned to its pre-recession level of 10.4%. Indeed, the youth unemployment rate was more than five percentage points higher than the rate observed in quarter 2 2007.

The youth unemployment rate (i.e. under 25 years) was consistently higher than the overall rate (for 15-74 year-olds) over the 12-year period. However, while the rate for youths was at least double the overall rate in quarter 2 2007 and in quarter 2 2012, by quarter 2 2019 it was almost triple the overall unemployment rate.
How does Ireland compare to the EU?

The EU-28 unemployment rate for quarter 2 2019 was 6.2%, a slightly higher rate than observed in Ireland for the same quarter in 2019 (5.4%). Ireland’s youth unemployment rate, however, was slightly higher at 15.7% when compared to the EU-28 rate of 14.1% in quarter 2 2019. (Source: Eurostat)

Why are youth unemployment rates so high?

Firstly, it is important to understand how the unemployment rate is measured:

*the unemployment rate is defined by the International Labour Organisation (ILO), as the number of persons who are unemployed as a percentage of the total number of employed and unemployed persons (i.e. the labour force).*

Across most labour markets in the EU, youth unemployment rates (15-24-year-olds) are higher than total unemployment rates. This is because, when compared to the older age cohorts, a much larger share of young people tend to be in full-time education rather than in the labour force.

When compared to quarter 2 2007, the number of under 25-year olds in employment in Ireland in quarter 2 2019 declined by 165,000\(^1\); however, since the number of unemployed in this age cohort remained the same, the youth unemployment rate was much higher.

---

\(^1\) This decline was due to a drop in the overall population in this age cohort (due to demographic factors including migration) and more people in this age cohort engaged in education and training.
What is the profile of the unemployed when examined by age (under 25 years versus over 25 years)?

The gender gap is larger for those aged under 25 years

In quarter 2 2019, males accounted for a higher share of unemployed persons in both age groups.

Unemployment rates mostly declined with greater educational attainment

In quarter 2 2019, the unemployment rate for all persons with a higher secondary level education or below was more than double the unemployment rate for persons with a third level education.
Those unemployed aged under 25 years had a much lower educational attainment than their older counterparts

In quarter 2 2019, 82% of all those unemployed aged under 25 years had at most higher secondary education; indeed, a third of these have attained only lower secondary education.

In terms of those unemployed aged 25 years and over, 43% had a further education and training (FET) or third level qualification.

Early leavers from education have a much higher unemployment rate than their counterparts

Early leavers from education are described as persons aged 18-24 years who have attained at most Junior Cert (or equivalent) education and who have not participated in education or training activities in the preceding four weeks. As such, they form a subset of the under 25 years of age cohort in the population.

In quarter 2 2019, 26% of Ireland’s early leavers from education were unemployed; this compares to all other 18-24 year-olds in the population (with greater than Junior Cert education), where just 9% were unemployed (Source: CSO LFS data).
80% of long term unemployed are aged 25 years and over

In quarter 2 2019, the age profile of long term unemployed (LTU) (i.e. one year and above) and short term unemployed (STU) persons differed considerably. Those aged 25 years and over accounted for the highest share of both short term and long term unemployed, but this was particularly the case for those classified as long term unemployed at 80%.

Prior to 2017, the LTU figures were not available for separate age groups, therefore the remaining long term unemployed was presented with a separate category of those aged 25 years and over. Each quarter, the number of persons aged 25 years and over accounted for 80% of the overall LTU figures.

Does the profile of the unemployed differ pre- and post-recession?²

There was a rise in the number of those aged 25 years and over who were LTU

The increase of 12,000 unemployed persons aged 25 years and over when compared to quarter 2 2007 resulted in a higher volume of persons who were long term unemployed. There were 8,000 more persons aged 25 years or over who were long term unemployed in quarter 2 2019 when compared to the same quarter in 2007. The increase in long term unemployed occurred for both males and females; however males had the higher share in both quarter 2 2019 (63% share) and quarter 2 2007 (65% share).

Otherwise, the profile has changed little

The profile of the unemployed has changed little over the period (quarter 2 2007 and quarter 2 2019). For those aged under 25 years, few changes were observed across many variables (in terms of volume of unemployment, gender and duration unemployed). There was an increase in the number who had no previous work experience, although this should be treated with caution.

Overall the profile* of persons aged under 25 years and over 25 years are almost replicating each other for the two time periods.
